I have a class that requests data from a server and I want to show a progress indicator while waiting for the data to come back. What would be the best way to do this? A: You can use a Handler and post it a Runnable. In the run of the Handler, start a new thread and run your ajax-request. If you need any return value of the request, write it to a String. You can also use the Volley library. This will have a similar function. Q: Android: How to write FQL in a long query I have a question about writing this kind of long queries in Android: SELECT actor\_id, full\_name, first\_name, gender, date\_of\_birth, region, source, start\_year, end\_year, user\_picture, actor\_uri, last\_update, status, source\_small\_image, status\_icon FROM actor WHERE actor\_id = \$\$user\_id\$\$ My question is, can I use inner\_join in this query or do I need to use something else? What is the advantage of inner\_join if I use the first query? I have seen examples of this kind of query with inner\_join, but I can't understand how they are written. A: You will definitely need inner\_join for this, because using inner join, you will get the records of the users whom the actor\_id belongs. Please have a look at the documentation for inner join : 2d92ce491b
