The majority of configuration information is typically handled through the use of configuration management tools or by reading the configuration of installed Cisco devices in order to discover the location of configuration data. Both methodologies can be used. The concepts in this section can be applied to the manual configuration of Cisco devices as well as the configuration of single server cluster network security: Your network can support many servers that are performing different functions. This functionality has many benefits, including: Simple design for small business. The simplicity of the design means less equipment, less space, and less configuration. It's a cost-effective solution. In this document, you will learn how to build a single server cluster in Microsoft Exchange Server. This document will help you configure the servers to share the workload for this application and improve its overall performance. To build a single server cluster in Microsoft Exchange Server, you must meet the following requirements: You must have a good understanding of the hardware and network components, as well as a familiarity Read More Enterprise Network Architecture/Disaster Recovery Cisco Network Architecture The business continuity and disaster recovery (BCDR) is one of the most common types of protection for network infrastructures. The purpose of the BCDR is to be able to maintain business operations after a natural disaster, business interruption, or other event. It is one of the most important network service in case of a major equipment failure, power outage, Read More Unified Communications Solution Note: This section provides information for configuring unified communications (UC) functionality. The majority of configuration information is typically handled through the use of configuration management tools or by reading the configuration of installed Cisco devices in order to discover the location of configuration data.
